(Engineer, Candidate of sciences) TITIE: Shock tubes and their application SOURCE: Strojnicky casopis, no. 2, 1965, 129-139 TOPIC TAGS: shock tube, diaphragm shock tube, thermophysical property, high temperature gas, real gas, boundary layer, shock wave ABSTRACT: This paper briefly describes the performance of a diaphragm shock tube and indicates its practical significance in aerodynamics and in the investigation of the thermophysical properties of high-temperature gases. The author analyzes the effects of a real gas on the flow in a shock tube: the influence of the change of real-gas properties at high temperatures and the effects due to the boundary layers on the shock tube wall, the evaluation of which is of great importance for correct interpretation of shock tube measurements. For the first foregoing case, the iterative procedure was derived to compute the state of a gas behind the shock wave. Rapid convergence of the iteration enables reliable evaluation of the state of a gas with respect to the real-gas properties. In order to take into consideration the influence of boundary layers, the author presents the theory which makes Card 1/2

TITLE: Calculating the state of gas in a shock tube

SOURCE: Strojnicky casopis, no. 1, 1965, 14-24

TOPIC TACS: gas dynamics, aerodynamics, shock tube, shock wave, gas compression, iteration method, bifurcation

ABSTRACT: When the membrane dividing a shock tube into high and low-pressure chambers bursts, it creats a shock wave traveling at a super-Mach velocity w1 followed by gas (usually hydrogen or helium), at a velocity u2, which is sharply compressed and heated. On striking the end of the tube, the wave is reflected at velocity w2 under higher compression and temperature. These conditions require very accurate metering for an extremely brief moment of a few microseconds, which may cause chemical reactions, molecular dissociation, even ionization and a shift in molecular weight. Boundary layers along the tube wall may distort the wave face and retard its velocity, particularly in the return wave, by what is called bifurcation. Heat may radiate to the tube wall and influence the temperature curve. The form of membrane burst, any roughness on the tube wall, or the direction and form of the wave face may influence its velocity and require experimental tests to

"Effect of Electromagnetic Radiation in the Frequency Range of Meter Waves on Workers on Short-Wave Transmitters."

Prague, Pracovni Lekarstvi, Vol 19, No 1, Jan 67, pp 5 - 11

Abstract /Authors' English summary modified 7: 30 employees working at short wave, and 19 working at medium wave transmitters were examined. The short wave transmitters exercise a stronger influence causing mainly a neurasthenic syndrome; 84% of abnormal findings were in the evaluation of the EEG. Deviations in the glycemic curve and an increase in the gamma-globulin content were also found. Permanent tests of EEG should be introduced for the employees exposed to the wave hazard. 7 Figures, 3 Tables, 10 Western, 2 Czech, 1/1 Polish reference. (Ms. rec. 3 Dec 65).

AUTHOR: Checking the Sharpening of Cutting Instrument Angles

(Proverka zatochki uglov rezhushchikh instrumentov) TITLE:

Professional no-tekhnicheskoye obrazovaniye, 1959, Nr 3, PERIODICAL:

pp 20 - 21 (USSR)

The author emphasizes the importance of a well-sharpened

cutting instrument and discusses the problem of checking the sharpening of cutters in training workshops. Practice has proved that it is difficult to check the sharpening of cutter angles with the available control gauges and goniometers. Thus an urgent necessity arose for a small device eliminating such shortcomings and permitting one to measure the angles of sharpening of such instruments as drills, countersinks, chisels, punches, etc. The author was successful in designing such a device, shown in Fig 1. consists of a basic disk of 75 mm in diameter with a graduat-

ed dial from 25 to 1400, having a cutout at an angle of

 140° , an incision from the reverse side of the disk for

Card 1/2

Checking the Sharpening of Cutting Instrument Angles

greater convenience, and a millimeter dial of 33 mm length. By means of the dial, the length of the cutting edges of a twist drill is checked on sharpening. The rotating disk, 60 mm in diameter, has a concentric dead recess, a cut with a graduation line and an opening at an angle of 140°. To explain the technique of measuring, Fig $\bar{2}$ shows examples of sharpening on various instruments. The Main Administration of Labor Reserves has arranged that the device be manufactured in a centralized manner. There are 2 sets of diagrams and 1 Soviet reference.

On the comparison of tilting and fixed open hearth TITLE: furnaces. (O aravnenii kachayushchikhsya i statsionarnykh martenovskikh pechey.)

"Stal'" (Steel), 1957, No. 5, pp. 411-413 (U.S.S.R.) PERIODICAL:

ABSTRACT: This paper is a comment on the paper by K.G. Trubin, "Stal", 1956, No.9. The above subject is discussed in the light of the results of operating 250 ton tilting furnaces on the Azovstal' Works. For comparison with fixed furnaces the results obtained on the Zaporozhstal' Works are quoted. After indicating that the bottoms of tilting furnaces require more maintenance the authors compare the productivity of both types of furnaces. The dependence of the output per hour on the bottom surface (Fig. 1) and on furnace capacity (Fig. 2) indicates that for furnaces of the same bottom area and the same capacity the productivity of fixed furnaces is better. Thermal efficiency of tilting and fixed furnaces is compared on the basis of heat losses and the extent of preheating of gas and air (Fig. 3). The stability of roof refractories in tilting furnaces is lower than in fixed ones; Azovstal' - 29 kg/ton of steel while on the Makeyevsk Works - 26 kg/ton. is concluded that technical-economical indices of tilting

TITLE: Remote Control of Steel-ladle Stoppers (Distantsionnoye uprav-

leniye stoporami stalerazlivochnykh kovshey)

PERIODICAL: Tr. Nauchno-tekhn. o-va chernoy metallurgii, 1957, Vol

18, 485-489

ABSTRACT: A description is presented of a design for the hydraulic

control of stoppers developed at Azovstal', making it possible to regulate the rate of motion of the rod within the range of 1-10 mm/sec and the pressure within the 5-50 kg/cm² interval. Hydraulic control of the stopper is performed by one man. Tests of this hydraulic equipment on the stand and in the shop yielded favorable results. After some modifications (increase of the stroke of the hydraulic cylinder, enlargement of the range of speeds of the stopper rod to 25 mm/sec, simplification of the adjustment of the hydraulic system, and replacement of spindle oil by a noninflammable liquid), this mechanism may be recommended for installation in open hearths.

TITLE:

The Use of Dinas-chromite Bricks in the Checkers of a Filting

Martin Furnace (Primeneniye dinasokhromita v nasadkakh

regeneratorov kachayushcheysya martenovskoy pechi)

PERIODICAL:

Ogneupory, 1959, Mr 5, pp 222-225 (USSR)

ABSTRAUT:

These experiments were carried out in the "Azovstal" Works where the Martin furnaces are operated by the scrap-ore process with the use of highly phosphorous cast iron (1.4 - 1.5 % P). The furnaces are heated with a mixture of coke- and blast-furnace gas. According to data given by YuVECh. (Footnote 1), the melting dust from the vertical canals of the Martin furnace has the following chemical

composition in during melting: 1.40 SiO₂, 3.00 Al₂O₃; 78.50 Fe₂O₃, 4.86 CaO; 2.07 MgO; 2.50 MnO. Table 1 compares

the operation values of furnaces with different refractory material in the checkers. Table 2 indicates the heating

Card 1/2

temperatures of the upper row of Dinas-chromite checkers. Figures 1 and 2 show the state of the Dinas-chromite checkers

The Use of Dinas-chromite Bricks in the Checkers of a Tilting Martin Furnace

SOV/131-59-5-7/12

of the right-hand air regenerator and of the right-hand gas regenerator after 286 melts. Table 3 indicates the chemical composition of the Dinas-chromite bricks and of the melting Layer in per cent after 286 melts. The petrographic investigation was carried out by L. I. Karyakin (Footnote 2). Conclusions: The Dinas-chromite bricks in the checkers wear out by the deposition of a melting layer on their surface. The positive results obtained with Dinas-chromite bricks in the checkers of the tilting Martin furnace permit the same to be designated as promising refractories, even under conditions of an increased drag of dust at a maximum temperature of 1350°. There are 2 figures, 3 tables, and 4 Soviet references.

DETERMINING FORCED VIBRATIONS IN NONLINEAR STABILIZING SYSTEMS (USSR)

Khovanskiy, Yu. M., P. A. Severov, and V. S. Slepkov. Izvestiya vysshikh uchebnykh zavedeniy. Priborostroyeniye, v. 6, no. 2, 1963, 63-73. S/146/63/006/002/007/010

An approximate method based on the use of logarithmic frequency characteristics has been used for determining forced vibrations in nonlinear gyrostabilizing systems. The method, which consists in subdividing the linear part of a system into a number of standard units for which logarithmic frequency characteristics are well known, makes it possible to reduce the volume of computation considerably. The forced vibrations are assumed to occur at the frequency of external excitation. A numerical solution has been obtained for a stabilizing system with a stabilization motor having a limited torque. The results were checked by means of an electronic model and found to be in good qualitative agreement, the numerical difference between the two results not exceeding 1.5 db. The study was conducted at the Leningrad Institute of Aviation Instruments.

B TITLE: Forced oscillations of a uniaxial system of gyroscopic stabilization with a zone of insensitivity SOURCE: Ref. zh. Metrologiya i ismeritel'naya tekhnika, Abs. 11.32.1712 REF SOURCE: Tr. Leningr. in-t aviats. priborostr., vyp. 44, 1964, 36-42 TOPIC TAGS: gyroscope system, oscillation, approximate solution, mathematic model ABSTRACT: The forced oscillations of a uniaxial system of gyroscopic stabilization with a zone of insensitivity of the progression-angle pickup are analyzed by an approximate method based on harmonic linearization. It is shown that nonlinearity of the type in question increases the amplitude of forced oscillations, as compared with the oscillation amplitude in a linear system. In addition, a zone of insensitivity narrows the passband of the closed system. The results of the analytic solution are confirmed by modeling. 5 illustrations. Bibliography of 3 citations. P. ABSTRACT: As a result of calculations made, recommendations are offered for designing the lower-pressure part of high-power turbines; these recommendations allow for the effect of steam pressure in the condenser and for the effect of the end area of the last stages on economical operation of the turbine. The turbine-unit maximum power vs. the heat-power-cycle parameters is presented. The expediency of using several exhausts, 2-tier blades, and 2-shaft turbine units is considered.

Peculiarities of the Distribution of Some Rare Elements in Metamorphic Rocks, Granites, and Rara-Metal Pagmatites of the Sayany (Osobernosti rasprostraneniya nekotorykh redkikh elementov v metamorficheskikh porodakh, granitakh i redkometal!-

nykh pegmatitakh Sayan)

PERIODICAL:

Geokhimiya, 1959, Nr 3, pp 252-258 (USSR)

ABSTRACT:

The lithium., rubidium., cesium., and beryllium contents were investigated. Lithium, beryllium, and cesium were determined flame-photometrically by G. N. Popova, and beryllium was determined by means of spectral analysis by N. N. Rodionova. Table i gives the contents of lithium, rubidium, cesium, sodium, potassium, and beryllium. Table 2 shows all the alkali metal contents. Besides, the lithium-, rubidium-, and cesium contents of the various rooks are graphically represented (Fig). The rubidium- and desium contents are parallel. In pegmatiles, as compared with granites, the content of lithium and beryllium is about 100-2014, that of rubidium 4 to 5-fold. In the later stages of pagmatite formation the content of rare alkalis decreases, whereas beryllium remains constant. The rubidium-

TITLE:

The thallium-rubidium and cesium-potassium ratios in metamorphic rocks, granites and rare metal pegmatites of the Sayany mountains

PERIODICAL:

Geokhimiya, no. 4, 1961, 359-361

TEXT: In a previous study the author dealt with the behavior of lithium, rubidium, cesium, potassium, sodium, and beryllium in the metamorphites, granites and rare metal pegmatites of the Sayany mountains (Ref. 1: Yu. S. Slepnev. Geokhimiya, no. 3, 1959). The present paper provides data on the thallium contents in samples used for previous studies. The analysts Ye. M. Zakharova, Z. M. Piskova, and A. V. Larionova determined thallium in the chemical laboratory of the IMGRE AN SSSR (Institute of Mineralogy, Geochemistry and Crystallochemistry of Rare Elements of the Academy of Sciences USSR). The accuracy is ± 10 - 20%. The following rules were observed: The thallium content rises from older rocks - gneisses, paraamphibolites (0.0002 % T1) - to granites (0.0003 % T1) and pegmatites

Card 1/3

S/007/61/000/004/003/004 B107/B207

The thallium-rubidium...

(0.0003 - 0.0008 %). The absolute thallium content in microcline and muscovite increases considerably as the pegmatitic process proceeds: Early generation - microcline 0.0005 %, muscovite 0.0004 %, late generation - microcline 0.0017 %, muscovite 0.0018 %. Among pegmatites, the microcline- and quartz muscovite complexes (0.0005 %) contain a higher percentage of thallium. The highest amounts (0.0007 - 0.0008) occur, where microcline and muscovite belong to the late generation. In sodium metasomatosis, thallium is not separated in contrast to potassium, rubidium, and cesium; it is distributed over albite (0.003 %) and the microcline and muscovite of the late generation. The Tl/K ratio does not remain constant in the rocks investigated; in metamorphic sediments it is between 1:2500 and 1:8150, in granites 1:11000, in pegmatites from 1:1000 to 1:6500. The Tl/Rb ratio decreases from schists (1:50) over granites (1:83) to pegmatites (1:150) (average). The Tl/Cs ratio does not remain constant in pegmatites: it is between 1:6 and 1:60. The T1/Rb ratio changes in muscovite from 1:120 (early generation) to 1:1025 (late generation) and in microcline from 1:290 (early generation) to ::350 (late generation). Accordingly, the Tl/Cs ratio in muscovite

Card 2/3

The thallium-rubidium...

S/007/61/000/004/003/004 B107/B207

changes from 1:40 to 1:55 and in microcline from 1:10 to 1:13. There are 1 table and 2 Soviet-bloc references.

USSR/Medicine - Tularemia

Jun 53

"Periods of Reinoculation of Subjects Inoculated Against Tularemia and Persistence of the Reaction to Tuberculin in Those Who Have Been Inoculated," M. V. Vasil'yeva, G. E. Afremova, V. A. Strigin, N. N. Slepneva, G. A. Dashkina, Ufa Inst of Epid and Microbiol im I. I. Mechnikov; Republic Bashkir ASSR? San-Epidemiol Sta

Zhur Mikro, Epid, i Immun, No 6, pp 50-51

After inoculation, 90.4% of subjects in areas exposed to tularemia gave a positive reaction to tularin within 2 mos, 81.3% within 6 mos, 79.6% within 1 yr, and 74% within 2 yrs. After reinoculation, the figures were 91.8% in 2 mos, and 91.3% in 1 yr. Reinoculation was carried out 1 yr after original inoculation.

MINAEV, P.F., SLEPOV, A.A. The Influence Exercised by the Local Irradiation of the Nervous A JOR

System with X-Rays on the Composition of Peripheral Blood. TITLE

Dokl. Akad. Nauk, 109, fasc. 2, 303-304 (1956)

PERIODICAL reviewed 9 / 1956 Publ. 7 / 1956

The cerebral hemispheres and the cerebellum of white Leghorn hens were irradiated by the directed X-rays (total dose 7000-9000 Roentgen) of a tube of 180 kV, 10 millampère with a series-connected filter of 1 mm Al + 0,5 mm Cu. The irradiated parts were at a distance of 20-30 cm from the tube and the dose was 85-114 Roentgen per minute. Both on the occasion of the irradiation of the cerebral hemispheres and also of the cerebellum all phases of cariokinesis of the limboblasts are noticeably in the peripheric blood, viz.: a distinct confusion of dependent reflectory activity, the fact that the clinical degenerations of nervous activity are strongest after 3-5 days, and considerable modification of the metabolism of the nerve tissue itself. At the same time, the oxidation mechanism of the glycosis is interrupted. On the occasion of the irradiation of the cerebellum the composition of red blood changes, nucleus partitions become noticeable in the mother cells, and even binuclear erythrocyts occur. On the occasion of the irradiation of the cerebrum such changes have as yet not been noticed.

The changes in peripheral blood on the occasion of the irradiation of the cerebral hemispheres and of the cerebellum are in a certain degree similar

and monocytes as - pavnorogical forms of cells occur on the occasion of the irradiation of all parts of the brain. On the occasion of the irradiation of cerebral hemispheres leukozytosis, and with irradiation of the cerebellum leukopenia occurs.

Also irradiation of other parts of the body CfA RDP86-00513R001651320002-1" an APPROVED FOR RELEASE of 27 25/2000 changes structural composition, but none of these changes are as strong as after the irradiation of parts of the brain, and they also vanish quickly.

Herefrom as well as from other works it follows that the nervous system plays the most important part in the case of all damage caused by irradiation. Changes in blood have secondary character. Perhaps the main cause of all blood diseases caused by irradiation is to be found less in the blood itself than in the nervous system. Such changes taking place in blood as are described here are most distinctly marked in the case of animals suffering from strong disturbances of the higher nerve functions. Cytological, hematological and histological examinations of the bone marrow and of the blood will contribute towards explaining the mechanism of the changes discussed here.

TITLE:

On the preparedness factor and optimal checking

period for standby control systems

13.1976

Izvestiya. Otdeleniye PERTODICAL: Akademiya nauk SSSR.

Energetika i avtomatika, no.6, tekhnicheskikh nauk.

1962, 150-155

The system is assumed to consist of series-connected TEXT: elements, the fault of any one of which faults the system. Individual faults are subject to a Poisson distribution. Marginal checking is carried out periodically according to a fixed programme, until a fault is detected. At this point the check is interrupted, the fault eliminated, and the system is then checked again from the beginning, by the full programme. The conditions for finding the optimal checking period are found in the article.

Transactions of the Conference (Cont.)

SOV/6206

COVERAGE: The book is a collection of articles delivered at the Conference on Plates and Shells held in Kazan' from 24 to 29 October 1960. The articles deal with the mathematical theory of plates and shells and its application to the solution, in both linear and nonlinear formulations, of problems of bending, static and dynamic stability, and vibration of regular and sendwich plates and shells in Various shapes under various loadings in the elastic and plastic regions. Analyzan is made of the behavior of plates and shells in fluids, and the effect of croep of the material is considered. A number of papers discuss problems associated with the devolopment of effective mathematical methods for solving problems in the theory of shells. Some of the reports propose algorithms for the solution of problems with the aid of electronic computers. A total of one hundred reports and notes were presented and discussed during the conference. The reports are arranged alphabetically (Russian) by the author's name.
